ABSTRACT

This one day workshop will explore queering as a design technique for troubling data and AI systems, ranging from quotidian personal data to recent Generative AI tools. By surfacing numerous instances of queering data or AI, we will come together to develop an archive of techniques for queering or artful subversion. From this archive, participants will select a technique and develop a speculative prototype or artifact via critical making. In doing so, we resist techno-determinism and conventional narratives of AI harms and benefits by tracing queer possibilities outside these categories.

CCS CONCEPTS

• **Human-centered computing** → **HCI design and evaluation methods**; **HCI theory, concepts and models**.

KEYWORDS

Queering, Data, Human-in-the-Loop (HITL), AI Systems, Design, Machine Learning, Algorithmic Systems, Queering-the-Loop

1 BACKGROUND AND MOTIVATION

The datafication of the world and the compulsion to become "data-driven" have long been critiqued, particularly when "objective" categories embedded in sociotechnical systems may harm those who fall outside of conventional categories [8, 9, 20, 24, 49]. For example, commercial gender facial recognition software powered by image data performs poorly on darker-skinned [10] and transgender [61] people. The recent proliferation of consumer-facing Generative AI (GenAI) products– such as ChatGPT, Dall-E, and Midjourney – seems to cement the encroachment of Data and AI into our everyday lives, further highlighting the importance of attending to where data comes from [32] and the politics of how we design with data [43].

The current emphasis on Generative AI parallels a similar trend in the 2010s. In her foundational HCI paper on queering, Ann Light paints a similar picture with the fast adoption of digital tools in our everyday lives [46]. She turns to Queer Theory to promote *queering* as a potential design orientation to resist dominant discourses. Queering involves disruption or breaking down categories [11–13]; it is a form of creative subversion that troubles the status quo. As other HCI scholars note, turning away from the status quo requires more than just observing the current state and (re)designing for it [41]. Instead, we must question why the latest technology is ingratiating itself into our lives and who has the most to benefit from its adoption – and who has potential to be harmed. Doing so requires designing in ways that resists the impacts of current technologization and centralization [47]. In this one-day workshop, we invite participants to consider how we may de-stabilize the looming narrative of datafication, algorithmic decision-making,

Figure 1: The instagram account, Rupublicans, that uses GenAI to generate images of political figures as drag queens in order to draw attention to their anti-queer/trans actions.

and its latest instantiation of Generative AI. In this workshop we will collaboratively devise techniques for queering AI, but also for the materials that predicate its existence: data.

In this vein, this workshop builds upon Light's provocation to queer by compiling various modalities of queering, grappling with the relational structure between archive and repertoire, a vital concept within Queer Theory [52, 53, 72]. Archives are a repository of evidence, and repertoires are forms of collective memories, imagination, and practices. Oppressed groups often rely on repertoire to pass down knowledge that exists outside of the master narrative [72]. For queer futurist José Esteban Muñoz, traces — remnants of what is left behind — denote this relationality between repertoire and archive [52, 53]. These traces are etched around the artful subversions employed by those who exist outside of the dominant class. Honoring the repertoire of queerness, we invite workshop participants to bring examples of subversions or (mis)uses of data and AI to build an archive of queer design techniques. These examples may be subversions of data and AI by queer people or using data and AI to queer systems, artifacts, or people (Fig. 1). These aren't mutually exclusive, nor is queering confined to these categories.

Collectively constructing this archive will be messy [31, 39]. The goal is not to be exhaustive, but embrace plurality [29]. In this spirit, our agenda concludes with an opportunity to play with these repertoires and craft more possibilities to trouble the status quo in HCI and AI. Utilizing critical making [57], we invite participants to take a hand at queering something of their own – whether it be their research, their art, or simply their outlook on this algorithmically determined world we careen into.

2 RELATED WORKS

2.1 Queering in Queer HCI

Queer HCI is a well-established interest area, with three queer SIGs that have convened since 2019 [22, 23, 68]. A large body of research studies LGBTQ+[1] people [7, 18, 33–35, 54, 61, 65, 66, 73, 74, 76]. Yet there is still limited work on queering as action, and Queer Theory in Queer HCI research [22, 68, 74]. However, there are a smattering of works that not only reference Queer Theory but employ it as a cornerstone of the research. For example, Spiel employs queer auto-ethnography to provide a personal account of how gender is encoded in technical infrastructures as a non-binary person[66]. This work exemplifies queering as a practice employed by queer persons. When queer people occupy spaces or use tools, they end up queering these spaces and tools themselves [1]. Other work uses queering as a means to subvert, critique, and possibilize dominant discourses. Harrer et al. queer and trouble the efficiency logics of the computer mouse by designing *The Undie Game*, where users wear a mouse controller in panties [36]. HCI work that troubles because troubling people are using a technology [42, 66] or troubles because it counters the prevailing logic [36, 69] pave the way for our workshop.

2.2 Cutting Across Other Critical Theories

While not explicitly invoked, there are many critical areas of HCI research that are rooted in the lived experiences of the plurality of people who are also Othered. Light connects Queer Theory to feminist scholarship [46], which is a well-established area of critical theory used in HCI and computing [3, 4, 24, 25, 27]. Another area is critical disability studies. Queer and disabled/crip lived experiences converge in multiple ways [15, 59, 60]. They are both exposed to unattainable normative prescriptions of how one is ought to be (e.g., heteronormativity and compulsory abled-bodiness), their embodiment and practices are constantly sanctioned and deemed transgressive and monstrous [45, 50, 63, 70]. HCI scholars call attention to these concerns not only by challenging the design of tools, like fitness apps [67], but also by using more playful approaches reminiscent of queering, such as humorous reversal of design norms around disability [40]. Finally, theories of racialization have also come into the purview of HCI. Some call for the use of Critical Race Theory (CRT) in HCI [55]. Others employ Afro-Pessimism as a means to question techno-solutionism [19]. Our workshop takes to heart intersectionality [17] and a view of power operating as a dominating matrix [16] and manifested in design [56]. Queering and an agenda that bridges repertoire with archive is not one that silos one form of alterity, but looks to the various entanglements of alterity as a site for traces of new worlds.

2.3 Solutionism... or maybe not

Queering is not a means to identifying a solution. The goal is not to simply discourage datafication or halt the proliferation of generative AI. Refusal, or choosing not to design, use, or take part in something, has previously been explored in HCI [5, 6, 30]. Instead, we wish to trouble the trajectories of data and AI. Refusal [5, 6, 30] and unmaking [58] are not incongruous with queering, but they are just two of many potential repertoires. Finding alternatives to solution-based approaches is also not a new interest in HCI. For example, Lindtner et al. provocatively present different forms of

[1] lesbian, gay, bisexual, trans, queer people and those belonging to other orientations, genders, and identities

design interventions in this age of "no alternative:" noticing differently, parasitic resistance, and walking alongside [48]. Cunningham et al. call out the paradox of technology solutions, particularly ones geared towards racial justice, when they are built out of the very things that predicate the problem [19]. These orientations that HCI scholars offer echo the nihilistic rhetoric of Queer Theory in the era of the AIDS epidemic [28]. However, moving obliquely around solutions is not confined to negation. An exciting reformulation of solutions is to take a pataphysical route, or consider the solution as imaginary. Sicart and Shklovski use pataphysics to rethink software, imagining absurd yet concise solutions to (imaginary) problems [64]. Such absurdism may be a tonic to techno-future of data and AI. It is also a burgeoning potentiality for design in HCI [44]. After all, as other HCI scholars point out, algorithms are perfectly capable at exacting absurdity themselves [2].

3 THEMES AND GOALS

In this workshop, we aim to find patterns and interweavings of queering in order to abstract out queer design techniques. This will involve collaboratively developing the beginning of a collection of design tools for queering, and using critical making as a means to reify our shared understanding. To achieve these goals, we will explore the following topics and themes:

1. Category is: Queer People? Queer Theories? or just qUeEr? Three current threads of Queer HCI are those that study queer people, those that use Queer Theory, or simply being a Queer scholar regardless of what one studies [22]. As Queer Theorist Eve Sedgwick Kosofsky argues, queering is a way of reading queerness from something, whether it is queer or not [62]. As we develop our archive, we do this as a step towards transcending these lines and categories in Queer HCI to better support a community and theory that prides itself on resisting categorization. Grappling with such question is tantamount to figuring out how we can queer Data and AI, whose very epistemology is predicated on categorization.

2. Unpacking relationality: Care with Data What is our relationship to AI when we interact with these data systems? There are human-in-the-loop systems, unsupervised learning, and treating AI as an adversary [14]. Queer Theory details relationalities that exist outside of the normative register, more than just naive notions of "good" or "bad". How might we care with data, AI, and more-than-human relations [21, 75]? How can it shift how we think about our relationship to these new technologies by attending to the particular ways in which data and AI are enacted in local contexts [71]?

3. Girl, interrupted: Upsetting Technopositive Discourses with Design We have all heard how data is the new oil [38] and why that's probably not the best way to think about it [24, 49]. It's hard to ignore the discourse around AI and its potentialities, utopian, dystopian, or otherwise. We invite participants to think obliquely and move beyond parroting the dominant discourse, whether for or against. In this vein, design–particularly speculative and critical design –presents an opportunity to encourage discursiveness in ways that may elide the current narrative [26, 37, 51]. How can we use materials beyond words to trouble the conversation?

4. How far can one go before going too far? As Phillip Core said, Dandyism [or queerness] "consists of being obsessed with and knowledgeable about the limits of 'how far one can go too far.'" Camp is one of many queer repertoires that pushes the boundaries of something, whether it be gender or AI. Artful subversions have consequences too, like applying political pressure (Fig. 1). How does queering inform how we think about the ethical consequences of Data and AI?
