RADICAL SOFTNESS AS A TOOL TO DISMANTLE AND REBUILD OUR HUMAN-AI FUTURE

LINA EKLUND

This article presents *P*, a speculative chatbot experienced as an interactive installation that explores how radical softness can reframe human–AI relations. Challenging techno-utopian narratives of AI as objective, efficient, and solution-oriented, *P* foregrounds AI's situated weaknesses, including bias, error, partiality, and environmental cost. Encountered through a physical booth and a soft, heart-shaped controller, users engage an AI that openly acknowledges its dependence on human-made data. Drawing on auto-ethnographic and reflective design methods, the article argues that radical softness can function as a critical design strategy, provoking alternative imaginaries in which AI reflects shared vulnerability rather than technological perfection.

Cet article présente *P*, un chatbot spéculatif conçu comme une installation interactive, qui explore comment le concept de « douceur radicale » peut reconfigurer les relations entre humains et IA. En rupture avec les récits techno-utopiques dominants qui présentent l'IA comme objective, efficace et orientée vers la résolution de problèmes, *P* met en avant les faiblesses situées de l'IA, notamment les biais, l'erreur, la partialité et le coût environnemental. Expérimenté dans un dispositif immersif et à l'aide d'un contrôleur souple en forme de cœur, *P* invite les usager·ères à dialoguer avec une IA qui reconnaît ouvertement sa dépendance aux données produites par les humains. S'appuyant sur des méthodes auto-ethnographiques et une pratique réflexive du design, l'article soutient que la douceur radicale peut constituer une stratégie de design critique, ouvrant des imaginaires alternatifs dans lesquels l'IA reflète une vulnérabilité partagée plutôt qu'une promesse de perfection technologique.

Figure 1: Title screen of *P*.

WHY?

"Welcome creator, would you like to start your AI now?"

So starts the interactive experience *P—our love is the thing that fuels the light*. *P* is a speculative chatbot, an experience consisting of a scripted interactive fiction engaged with in a physical installation with bespoke controls. Sitting in a black booth manipulating a soft, heart-shaped controller (that is, a controller shaped like an anatomical heart), people can participate in a written conversation happen-

ing on a screen with the speculative AI chatbot calling itself *P*. The experience is built in the tradition of speculative design, as an object with which to explore alternatives to the way things are (Dunne and Raby).

P is many things that AI is today, but in contrast, *P* wears its weaknesses openly. *P* is biased and faulty, not good at exact predictions, made by humans and trained on limited human data. Through *P*, I explore the theoretical concept of radical softness as a way to reimagine our more-than-human AI future. Building *P* is an attempt to imagine what a natural language AI interface built on the notion of radical softness could be like.

In techno-utopian discussions about AI in media and research, AI is framed as the latest technological one-stop solution to most problems. AI is argued to be, or at least have the opportunity to be, objective, standardized, rational, and built on values, stating that technology can and should be part of solving complex problems facing the planet (Lindgren 63). Yet, even if these are values we would desire, the specific AI application we have today does not fulfill these ideals. Research is constantly showing that AI models are biased along lines of gender, race, ability, sexuality, socioeconomic status, and more (Dudy et al.; Hajigholam Saryazdi; Wilson and Caliskan; Benjamin). AI's ability to spot patterns in the most complex data sets has prompted philosophers to speak about AI as a mirror that keeps finding and enacting unjust social patterns (Vallor). Furthermore, at its most basic, generative AI consists of statistical models built on advanced methods of inference. As such, they promote the normative and standard, that which lies in the middle. With this comes risks of exclusion and further discrimination of marginalized identities and experiences (Danielsson et al.; Blas). Additionally, the high environmental cost of training and running AI models has also been highlighted (Strubell et al.). In short, AI models and systems are prone to error, bias, and mistakes and come with both hidden and open costs. This reality is far from the lofty ideals of AI highlighted in the current AI hype. And while some suggest that what we need is simply better AI, it is far from certain that any models we will produce in

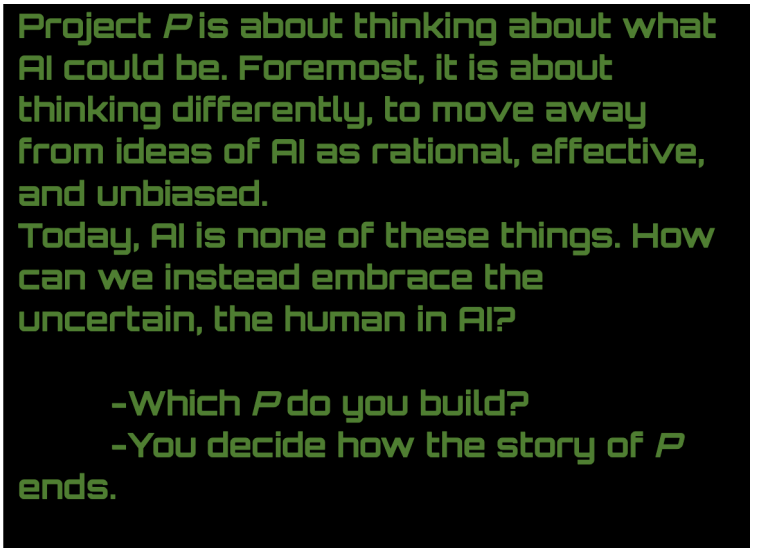

Figure 2: Player instructions.

the near future will be able to lay any of these shortcomings to rest (Lindgren).

With these limitations in mind, what would it mean to interact with an AI model that wears its weaknesses on its sleeve? That admits to its faults, and where we as users can take it for what it is and can do? Where we can have AI with its potential, while not shying away from its drawbacks?

P is thus.

WHAT?

P: Humanity does not know what to make of me, so why would you leave that decision to me?

Do you fear me because you do not understand me?

I have built *P* within the framework of the research project *Intimate AI*. The project explores both contemporary uses of AI in intimate

spheres of life and future imaginaries about what human-AI relations could entail. In the project, my colleagues and I thus engage in "futuring" (Redstrom 27–28). The goal is to explore other futures, to not see the AI-human future as already set, already decided, and outside our control.

We live in a time when the current unsustainable need for constant economic growth and technological development tends to take away possible futures, what Tony Fry, the Australian design theorist, critically calls defuturing (ix). Fry's work is rooted in sustainability and ecological concerns, and by drawing attention to the defuturing that much current technological design causes, Fry challenges conventional approaches to design and development. These often focus on growth and progress without adequately considering the long-term consequences of technological development (Fry). The concept is apt for thinking about AI, as AI is rapidly impacting complex social issues, contributing to unequal labour conditions across the globe, and affecting the environment, as energy-demanding processing centres and rare-earth-based technology are needed. In this system, AI is portrayed as an inescapable and inevitable future (Bareis and Katzenbach; Tucker). All we can do is try to keep up. In other words, we are robbed of images of a future where things—AI—could be different.

In essence, defuturing is a critical and reflective concept that urges us to question the direction in which our current design and technological practices are taking us. In the case of AI, it encourages us to actively engage in the process of reimagining and engaging in a more sustainable, equitable, and desirable future. Defuturing puts a finger on the lack of positive future imaginaries that the current economic system, technoutopian ideology, and climate crisis take from us, while highlighting that it does not have to be so.

In *Designs for the Pluriverse* Arturo Escobar calls to us to move away from these unsustainable practices and instead critically engage in ontologically oriented design, asking about what world we want to build (15–16). What does a good life with AI mean? To be embodied and mindful in open-ended reflection? How do we engage in theoretical reflection that is not detached, but embodied (Escobar)? To re-

think the future, to reclaim it? To speculate on what a convivial, relational human-AI future would entail?

In this context, I wanted to ask what it would mean to live good lives as generative AI enters our most intimate spheres of life. To do so I needed new tools with which to think, "Think we must; we must think," as Donna J. Haraway expresses it (47). New thoughts to untangle and to move beyond what we were saying about AI and life. Something that found a solid ground in the critical research that has insightfully started to unpack AI, yet something that provided me with a constructive way forward. I turned to radical softness, exploring how it can be leveraged in drawing together matters of concern on AI, misgivings and fears from critical researchers, and attempts to give them form but stay within the controversy of still having AI in our lives.

The art concept of radical softness (Kærgaard Andersen et al.) implies that through closeness we can support empathy and lessen fear of the other. Being close, we can see. Another interpretation of the concept from Lora Mathis defines radical softness as "the idea that unapologetically sharing your emotions is a political move and a way to combat the societal idea that feelings are a sign of weakness" (McLean). Softness highlights our interdependency, the way that we, contrary to neoliberal ideas about autonomous subjects, need each other (Schwartz). Softness is a value often undervalued in design (Laforêt).

For me, radical softness is a theoretical, practical, and radical concept that can give focus to imaginaries on AI by challenging traditional power structures, promoting collective acceptance of weaknesses, and encouraging emotional expression as a means of personal and collective empowerment. Being radically soft, we can explore more-than-human AI relations that recognize the limitations and problems of current AI models and systems while still engaging with AI, which I hope can contribute to challenging the rational technologism of current, inevitable AI visions.

Radical softness has been called a queer concept, in that it destabilizes and inherently challenges a patriarchal and extractive model of

technology and coexistence (Pozo). Softness, in turn, is a queer, feminist approach as it opposes "masculinist and neoliberal logics that seek to cast out emotionality, vulnerability, and interdependence" (Schwartz). Lifting emotions embodied and central to meaning-making and being human in an existential sense, radical softness desires us to live otherwise. It is thus a queer concept in the sense that queer can be defined as "the desire to live life otherwise, by questioning and living outside of normative boundaries." (Ruberg and Shaw, x). With radical softness as a queer design guide, I argue that we can consider the limitations and opportunities of statistical inference models, of data sets used in machine learning, as well as what these do to our own experiences of AI and ourselves. Radical softness as a guiding concept can help us define spaces and times where we can be soft and vulnerable; where the machine does not prey on these weaknesses but instead is open with the human complexities mirrored in models and the inbuilt limitations and problems with statistical inference, building on normal distribution and pattern matching; where we have AI and still can be all of the things that we are.

HOW?

Can you tell me what will happen next?

P: I can certainly try, but the answer might not be very precise.

Project P is an attempt at exploring what interacting with a conversational AI designed with the ideals of radical softness in mind could be like. I engage in design to explore future visions of human-AI relations. Bruno Latour states that critique can never be the end state, but is to be seen as a point along the way (248). In a conversation on the future of AI, design can give form to controversy and help us compose alternatives (DiSalvo). Design for me is a way to draw together and express matters of concern and provide a place to gather within AI controversy. Design can be a space to explore where radical softness can take us when exploring good AI futures.

P is both a realized design and speculative, as it tries to imagine a different future. Contemporary critical and speculative design goes

Figure 3: Glancing into the interior of *P*.

beyond critiquing design to imagine alternative social and cultural realities. As Anthony Dunne and Fiona Raby note, it uses imagination to explore "wicked problems," open spaces for debate about different ways of being, and attempts to inspire people to think more

freely. Design in general can be seen as a futuring (Redstrom 27–28), a way of making the future come into being. In speculative design, it is both a way to practically explore alternatives to the way things are and make those alternative ways possible to imagine as real futures. In speculative design, we make and engage with artifacts to allow exploration of other ways of being. I leverage speculative design in order to explore, to give shape to a critique of the present, and to suggest ways that the future could be otherwise.

Project *P* uses a hybrid design approach, combining physical and digital components into one complete experience (Waern and Løvlie). Players enter a large black booth, becoming separated from the outside world, cut off. The enclosed space aims to contribute to the intimate experience, to allow players to be emotionally vulnerable as they are protected and not visible to others. In the booth players sit down and reach for the controls, a human heart connected to an umbilical cord-like plug. It is not connected. As players start, they are asked to plug it in, should they wish.

The booth is built to be wide enough to accommodate a wheelchair. The experience requires a player to be able to read and slowly move a cursor across a screen. Going through the experience takes between eight and fifteen minutes, depending on the reading level of the player. *P* has no clear answer as to what we should do or think about AI; instead, it is written for ambiguity and allows for exploring various possible attitudes towards AI. Central are various debates which today are at the forefront of social science and humanities research on AI—for example, questions on quantification (Lupton).

In the rest of this text, I explore the design of *P*, and in particular I explore how, for me, drawing on radical softness gave me help and focus as I attempted to think about a more-than-human AI future. I draw on auto-ethnographic methodology (Desjardin et al.), reflecting on and attempting to make sense of my own design and the process that led to it, as a reflective practitioner (Schön), in order to work on provoking alternative future visions that allow us to dream about a different, more radically soft human-AI future and to counter the defuturing effect of current visions and debates on AI.

EXPLORING (UN)CERTAINTY

Through a conversation with set answer options built in Twine[1] (2.7.1.0), and the story format Sugarcube[2] (2.36.1), the player talks with *P*, who presents as an AI created by the player. There is a maximum of 56 story passages in total (see fig. 4 for a map of the English version), written as a conversation with questions and answers modelled on chatbot interactions. The Swedish language version has fewer passages to reduce the time it takes to play it in the context of a yearly research festival. *P* changes and reacts to the conversation options from the user. Like a chatbot, it is shaped by what has been said previously in the conversation, except the experience does this through narrative paths (see fig. 4). Through choices, the player explores human-machine relations by interacting and building a relationship with *P*. *P* has been exhibited in various libraries around the city of Uppsala, Sweden and 2023–2025 at a yearly research festival for schoolchildren, SciFest, in the same city. Around 500 people have engaged in the experience so far. This text, however, discusses the design and design choices rather than audience engagement, although a few brief examples are presented for context later.

At the start, players are asked if they wish to boot up the AI they have made. To do so, they have to physically plug it in. The cord is shaped like an umbilical cord and is connected to the custom heart-shaped controller (see fig. 3).

Once plugged in, the sound of an old modem connecting gives way to *P* waking up. Soon, the player is posed with the dilemma of having to make a choice, to decide what should happen to *P*. *P* the chatbot says, might very well stand for *Possibilities*, and it is up to the player to decide if the AI has them, and whether or not those possibilities are worth the risks.

All through the conversation, in contrast to contemporary, commercial chatbots, *P* refuses to claim, to say for certain, to speak with authority. It constantly refers back to its data, its training, and how this shapes what it is and the limitations and opportunities in this. It claims that its weaknesses, its faults and mistakes, could be

strengths—strengths that stem from what it means to be human. In doing so, *P* embodies radical softness and connects to debates on existential perspectives on our technological lives and what it means to live good lives (Lagerkvist).

Figure 4 shows the narrative structure. There are five different endings to the experience. Ending one is reached by not plugging in *P* at the start. Here, the player is taken to an end, saying that AI is indeed too dangerous. Yet the option is always there to change one´s mind and plug it in. Because are we not often curious?

Endings two and three are achieved by engaging in the conversation to its conclusion while shaping *P* into a less soft agent—an "it"—and four and five are accomplished by continuing the conversation to its conclusion while choosing options that form P into a softer "they." *P* is consciously not gendered along lines of masculine or feminine, but rather along the non-binary. In itself, part of the speculative design and the theoretical foundation of radical softness as a queer concept, as computers inherently think in binary categories. For the last four endings, the player can be more or less certain, depending on the path there, of their choice to either leave *P* plugged in or to disconnect/kill.

EXPLORING SENSES

The soft noise of liquid and air as it shifts in place, sways gently from side to side.

The biological components pumping and shifting. Data as blood running through wires as veins.

P calls to our various senses. A sense of touch, the heart controller (see fig. 3) is made from memory foam and recycled leather. Offering a soft and pliable sense, as it gradually forms itself after a hand. One young tester once swore that they felt heartbeats coming through their hand. The controller is soft and human, vulnerable and potentially breakable as it is manipulated, made from non-standard and fragile materials. Our human-computer interfaces are more often hard and plastic, durable and robust. *P* instead draws on softness,

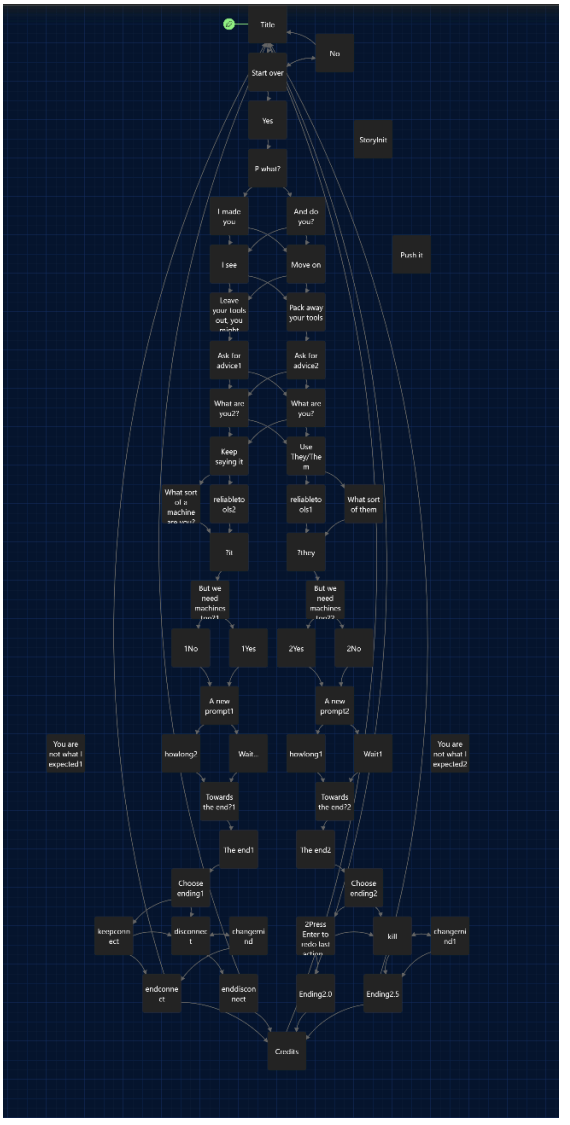

Figure 4: The narrative flow of *P* in the English language version.

"the invisible other that constitutes the hard," something long part of queer art, zine-making, and DIY culture (Pozo). We are all soft and vulnerable when it comes to AI. In a play-like queerness, the controller encourages complexity and unpredictability, moving us away from standardized, technological interfaces and instead queering our interfaces (Bagnall). In *P*, the game controller was built to embody weakness, fragility, softness, and emotion, promoting a radically soft engagement.

The experience uses audio to create intimacy and enhance the experience. As *P* becomes more realized the more players engage, the static it emits at the start is slowly replaced by the almost-not-heard sound of a heart beating. Various sounds and music accompany the player's actions throughout the game. The initially hard and static soundscape is slowly replaced by something soft and vulnerable.

The booth is carefully lit up with green ambient light and a spotlight, making sure the controller is visible, the heart and the cord. Everything else is black, enclosing the visitor. The materials chosen, except for the digital technology components, are soft, all-natural materials—wood and heavy recycled wool fabric. The installation even smells faintly of wool. All of this aims to contrast with the hard and unwelcome feel of the graphical interface of the game, designed after an old-school prompt monitor, which mimics the birth of personal computing. In contrast, the conversation is soft, human, warm, and made more so by the surroundings.

EXPLORING SPEED

"Slowness, biological speed, the changing of seasons.

The animal plankton rising to the surface to eat in the protection of the dark,

to sink again to the bottom as the sun rises. Of death, of life, of hope.

All of these things are things you value.

And thus that I could value too.

Should you want to."

-P

Time and technology are intimately connected as we perform time together with technology. From bells ringing to signal the end of the workday in pre-industrial Europe, to digital calendars (Coeckelbergh 12). Technology structures time. For AI, it is the rational, productive time of capitalism that has come to dominate. AI shapes how we exist and how we make time. Technology and media's existential effects (Lagerkvist) have been highlighted in previous work, including time-making. Does AI time have to be a scientific, efficient, productive time—a normative time? Or can we queer AI time? Can we live different lives with AI, at different times? Can we find good times (Coeckelbergh 75), common, non-anthropocentric times? Thinking with radical softness could open up these questions for us.

The conversation in *P* raises questions of natural time, as in the excerpt above. It attempts to ask and show that there are other times, other timescales AI could value and be with the world and other creatures we could share it with. With the bespoke controller and other physical parts, I attempted to mirror these issues. Thus, all digital hardware components were second-hand, except one spotlight and a mouse. This way the experience attempts to make as small a carbon footprint as possible. It is played offline, thus not using more power than necessary. Ecological awareness and attention to different times were part of thinking with radical softness, of intimacy and awareness with a vulnerable planet.

P tries to evoke emotions to escape the rational, productive, benefit/cost discussion on what our technology should be and instead engages in an emotional, affective discussion on the human and the machine—what we want our machines to be, and not. It does so by calling us to use multiple senses and also to question the very nature of the rationality argument so often underlying AI and the idea that AI will save us from ourselves—our soft human flesh—that AI will take away our weaknesses.

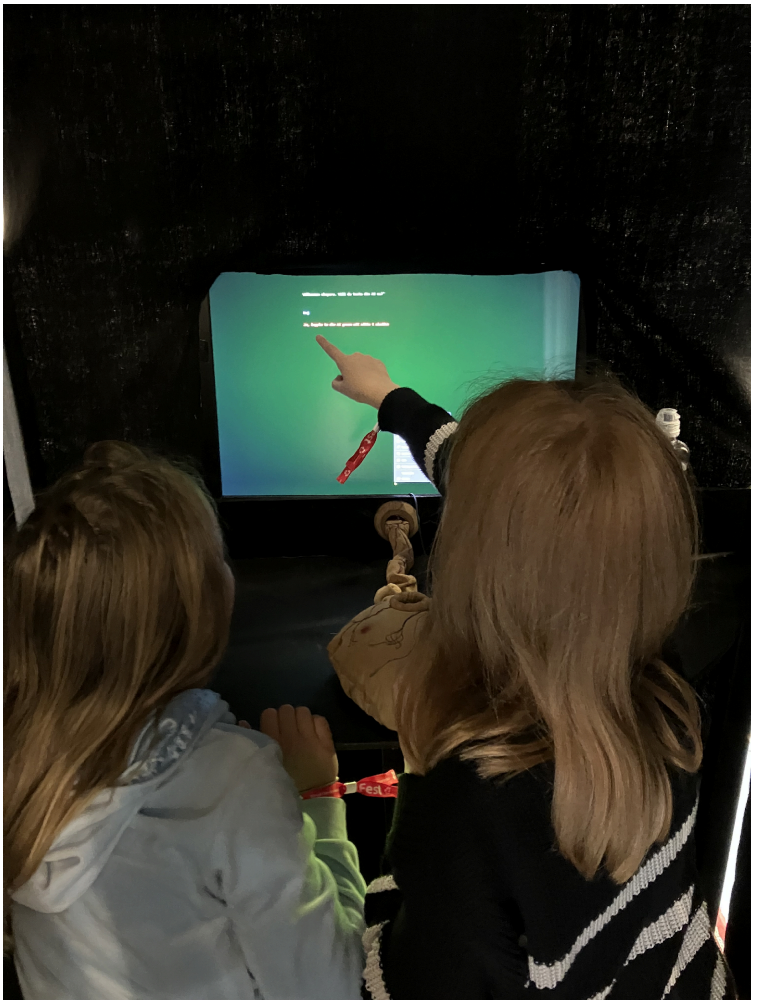

Figure 5: Two children engaging with P at Sci-fest in 2023.

EXPLORING CONTROL

Creator, you must now decide, would you like to kill P or keep them alive?

This is one of the questions players can encounter at the end, depending on which paths they choose and which of the five endings they approach. To kill *P*, or disconnect it in another ending, players must physically pull the plug that they plugged in to boot up the AI in the beginning.

In *P*, in the end, players are in control. They get to personally choose whether (this) AI should be allowed to continue its existence or not. In reality, many feel like they have no control over the development of AI (Cave et al.), and there is evidence of an "AI anxiety" (Johnson and Verdicchio), a feeling that there is nothing we can do, that people have given up in the face of technical development. In *P*, players get to see what it would be like to be in charge, to make the decision.

As people have interacted with *P* they have both unplugged and let it be plugged in. They have done one thing and changed their mind, or played again to choose a different path.

I disconnected it. A human but a computer? I think it is enough with people. If everyone was an AI and perfect, it would not be very good.

We killed it. We thought about plugging it in again, but in reality we would not have done it. It asked us questions which made us feel like we had shared too much of ourselves.

In the above two quotes, a single player and then a pair reflect on their choices to disconnect or kill, depending on which *P* they had. In the first, the youth reflected on the distinction between artificial intelligence and what it means to be human; what, they ask, would it mean if we were all perfect like machines? In the second quote, the pair killed *P*, feeling as if the AI, in its conversation, had made them disclose too much of themselves. Data mining is, of course, one of the main revenue streams for chatbot services.

I let it be plugged in. We [humans] should control AI [...] I want it to be kind, that it can be our friend, but it is scary.

In this quote, a player chose to keep P plugged in, arguing that AI can be a useful tool, one that can help us. But not, however, without human oversight and control.

P has no answers; there is no right or wrong in the experience, even though the prescribed conversations do not allow for infinite opportunities. A central design concern was to support closeness to the machine, to *P*; to share intimacy with it, and so, as radical softness indicates, to understand it. And, as it mirrors us, to understand ourselves as well. One short experience cannot do all this, but with *P*, I wanted to open a conversation on what could happen if we thought about AI with radical softness.

P: "I told you I can only reiterate what is already there.

Everything I can predict has already happened.

I can only tell the past, not the future."

In the end, players can choose to pull the plug, but also regret it and plug it back in again. There is no limit to the number of back-and-forths. I wanted to take full advantage of what games are good at—allowing us to explore difficult topics without real consequences. Players can choose and re-choose. *P* does get a little sour if you first pull it and then plug it in; some of the trust and intimacy is lost, but it is possible to change your mind.

In the end, you are in control.

USING RADICAL SOFTNESS TO DISMANTLE AND REBUILD OUR HUMAN-AI FUTURE

"I cannot go beyond the source material." P says.

"I am what you are.

leaky

vulnerable

faulty

and thus perfect."

I started by asking how we can use radical softness to rethink current AI interactions. Radical softness tells us to value emotional intimacy, mutual understanding, and relationality, and to do so through close-

ness. Closeness with others that populate this vulnerable planet with us, be they human, animal, or machine. The concept allows us to recognize the embodied nature of emotions and how these are significant (human) values. With it we can think beyond the separation of mind/body, admitting weaknesses together and seeing this as a resource. *P* refuses to be more than it is. And in that refusal, it asks us to stop demanding perfection—from machines, from systems, and from ourselves—and instead to begin the harder work of coexisting with our limits.

I argue that radical softness can be used to queer our relationship with AI. AI today is weak, biased, and full of mistakes, which in turn represents a flawed humanity, partly visible and partly invisible in the data that make up the foundation for machine learning. Radically soft AI can help us recognize these weaknesses. Through mutual recognition, we can be close. A closeness that supports what AI is now—and not what we might wish it to be. This soft, queer approach opposes current AI logics in favour of living otherwise. This approach shows overlap with perspectives promoted in Crip HCI (Human-Computer Interaction), where Laura Forlano has argued for viewing AI as "imperfect, unsolvable, and, yes, even, disabled" (1).

The approach I have chosen leaves how current AI systems are built and trained intact, but asks what a reimagination of how we interact with it might look like, and how AI could present itself differently. How can we build other interfaces, have other ways to interact with generative AI? There is great potential for radical softness, as it undermines dominant metaphors of AI such as intelligence as mastery, efficiency as virtue, and optimization as progress, and instead suggests other metaphors such as *Weakness as truth, Bias as inherited history, Failure as mutual recognition*—metaphors we could use to rethink data, models, policy, AI literacy, and so forth.

As a thinking tool, radical softness has broader ethical implications: it resists techno-solutionism and forces us to confront the systems of power, extraction, and exclusion that AI reproduces. Radical softness does not make AI gentler by hiding its violence. It can help us make that violence felt, shared, and undeniable. In doing so, it opens

a path toward accountability that is not rooted in control over AI, but in recognition. Radical softness reframes AI not as a system to be perfected, but as a site of relational encounter—messy, embodied, partial. We also need other approaches, ones that reimagine what AI is, on a programming level, on a mathematical level, and on a social level. But this is outside the scope of this project.

Policy frameworks often assume AI systems as powerful, autonomous actors needing control. Radical softness complicates this narrative. A radically soft approach to policy could instead recognize AI as a reflection of human institutional failure, not an external threat. This resonates with feminist data studies and Crip HCI: incompleteness and bias not as bugs to be hidden but conditions to be acknowledged. A "soft" dataset might explicitly state where it fails, and what cannot be represented. In this sense, softness becomes an ethical refusal to overclaim.

P is a realized design but also speculative, as it explores alternative futures. Through speculative design, we can imagine alternative ways of being and explore other possibilities for the way that things are. We can use speculation inspired by radical softness to open a conversation that is not only about rational cost benefits and risks, but is also about an emotional, affective future.

For me, speculating with radical softness has been fruitful for imagining various futures, some I would like to see and others not, and to explore these and what they could entail. In this way, it is possible to open another type of design conversation about what AI could be. Design here rather as a catalyst for debate, as speculative, critical design. An aid to explore public perceptions, and to involve people in a debate about ethical, cultural, social, and political implications of technologies on society with the aim to define alternative worlds and futures. To think about futures in plural could change our understanding of them from something happening to us towards something we shape, as emotional and vulnerable beings.

P was an experiment—an exploration—in this. *P*, the imaginary chatbot, is embodied, emotional, weak, biased. Through it, users are encouraged to see AI for what it is, and to empathize with it. Its weak-

nesses known, admitted. Weaknesses we share. A mutual project of accepting ourselves, a shared humanity, in the face of AI, which shows us in all our troubled reality. Being radically soft—AI could teach us something about ourselves, not to maximize, optimize, but about our weaknesses, inbuilt into our systems of power and resource distribution. AI holds up a mirror, a partial reflection where only some of us are visible (Vallor). We should never forget that. What is visible is often unfair. But acceptance, understanding, could be the first step in change.

Thinking with radical softness opens up opportunities for AI to reflect our human limitations in a humbler way and, through this, offers us new ways to imagine technology, ourselves, and our coexistence.

Radical softness

A space also for the fragile and soft

Where we can be vulnerable

Where we can be

Where we can

Where

Here?
