THE "HOUSE ARREST" OF MICHELANGELO'S MURAL DRAWINGS

Jonathan Foote

On the morning of March 22, 1976, restoration technicians Sabino Giovannoni and Guido Botticelli made an astonishing discovery. Underneath a thin layer of bone white stucco in Michelangelo's Medici Chapel at San Lorenzo, Florence, the first clues came to light of 100 figural and architectural sketches in red and black chalk, rendered directly on the walls of the apse, possibly by the hand of Michelangelo himself.[1] Situated to one side of the Medici tombs and produced between 1524 and 1525, the wall drawings were frozen for centuries into the vertical *intonaco* surface. Two full-size drawings, depicting the interior and exterior window of the adjacent Laurentian Library, are the largest architectural drawings in Michelangelo's remaining *oeuvre*. The discovery inaugurated a long chronicle of careful restoration, scientific documentation, and public interest, thereby fully integrating the wall drawings into contemporary regimes of art history and heritage conservation. Within three years, a meticulous catalog of the drawings, including some preliminary assessments, had been published by Paolo Dal Poggetto, then-director of the Museo delle Cappelle Medicee.[2] By the time Caroline Elam published an important essay on the topic in 1981, scholarship had been generally settled on issues of authorship and historiographic significance.[3] Since that time, aside from some new photography and an updated publication by Dal Poggetto, little attention has been paid to these magnificent marks in the Medici Chapel (Figure 2.1).[4]

Upon discovery, Dal Poggetto and his team immediately reconstituted the discovery as an archive of mural drawings that could be published and studied by expert eyes. Since the drawings themselves were fixed to the architecture, they had to first succumb to a process of *registration*; that is, they were reproduced as conventional documents, which could be moved, described, and published. The primary technical approach was flat, close range photography, where each drawing was carefully identified, systematically located, and measured. Several of the most important drawings were graphically recreated and isolated from the wall palimpsest, making them available for the objective gaze of the historian. The wall drawings were submitted to a universalizing, organizational regime that fixed the drawings as found. While this process has certainly benefitted the study and accessibility of the drawings to historians, one must also acknowledge certain prejudices: the objectifying procedure, which dislocates the drawings from their place of making, blinds the historian to the fundamentally spatial construct of the wall drawings. Indeed, as marks made *in situ*, they are inseparable from the architecture itself, presenting a direct challenge to conventional methodologies of archival documentation.[5]

In recalling the original notion of the archive, however, the potential of these drawings to be grasped architecturally may be critically discussed. Unlike the modern archive, the original Greek *arkheion* referred to the place where documents were made and interpreted, and it was not a reference to the documents being kept there.[6] The link between the origin of documents and the place of preservation persists in the logic that, for example, Henri Labrouste's drawing archive belongs in Paris, the Archivio della Fabbrica di San Pietro in the Vatican (AFSP) resides appropriately above one of St. Peter's barrel vaults behind a monumental pier in Rome, or John Soane's drawing archive fits perfectly well inside his famous house at Lincoln's Inn Fields in London.[7] This phenomenon was examined by Jacques Derrida (1930–2004) in relation to Sigmund Freud's house in London.[8] The house, upon Freud's death in 1939, became the final resting place for his archive. The documents, Derrida wrote, are preserved "under the title of the archive by virtue of a privileged *topology*." By transforming the house into an archive, the documents were thus placed under 'house arrest' and went through a process of "domiciliation."[9] Following Derrida, if documents are moveable or even digitized, one could say that the archive is always defined in relation to the place where it is preserved; that is, in terms of its domiciliation. Putting aside the most difficult questions of provenance and repatriation, the underlying impulse described by Derrida is nearly self-evident: where something is made has a special status in relation to where it should be preserved.

Subsumed into the fabric of the Medici Chapel, Michelangelo's domiciled drawings have the effect of converting the space into something of an archive. Yet, this is not the virtual archive of Dal Poggetto, a simulacrum that has been dislocated and objectified; rather, it is an archive in the original sense of the *arkheion*—as *sui generis* marks experienced directly in relation to the place where they were created. Materially fused into the architecture, Michelangelo's demonstrations in red and black chalk create a visceral connection with the confabulations of the building site of the 1520s, thus turning the chapel, today, into a fecund place for active remembering and architectural thinking. One contemplates questions such as the impact of scale and drawing in full-scale, both measured and unmeasured, body posture and movement in the drawing, the role of specific drawing materials, and the relation of

drawing to building in the place of construction. This essay investigates the drawings as an archive in three ways: first, with regard to the importance of their *in situ* location and spatial relation to the building site; second, as life-size, embodied marks that recall a memory of construction; and third, as a material palimpsest that re-activates past practices and gestures. It will be shown how the drawings remain, in short, domiciled demonstrations of crafty thinking and surprisingly potent documents for architects, even if they have long outlived their conventional role for guiding construction activity.

The occulted drawing

In situ architectural drawings are preserved for a variety of reasons. Many have disappeared, a result of their enormous size or ephemeral drawing materials. Brunelleschi's full-scale, working drawing of the Florence cupola, marked out in sand on the banks of the Arno, is a good example.[10] The survival of *in situ* drawings is due in part to their degree of occultation or hiding; in how they were preserved for view by being placed out of view. For Derrida, this is summed up in the need to '*abrite*' or shelter, the contents, which is akin to an act of purposely forgetting, or "[sheltering] itself from the memory which it shelters."[11] Sheltering the drawings *tucks them away*, preserving them unfinished as latent constructions. The latency of an *in situ* drawing recalls its origin in the Greek verb *lanthanein*, as when "something escapes me, remains hidden from myself."[12] When taken as an archive, this latency invites us to ruminate upon the relation of the drawing's location in relation to the building site.

Most surviving drawings on building surfaces were sheltered by being 'set aside'; that is, they were kept as left-over in stairwells or other auxiliary spaces. The hiding or setting aside of *in situ* drawings guarantees that they stay unfinished, are not *used up* in construction, and remain available for new disclosures. In Trogir Cathedral, for example, full-scale drawings occupy several of the flat roof areas, a not uncommon location for working drawings.[13] Often, a small adjacent room was used, as in the vestry of the Murcia Cathedral, where vaulting demonstrations are incised on the walls, or in a small tribune within the chapel of San Telmo de Tui, where several layers of drawings are scored onto the floor.[14] In many regions, a particular typology emerged, where drawings could be intentionally sheltered out of view but within proximity of the building site, such as the establishment of a tracing house, *casa de la trazo*, or *chambre aux traits*.[15] At Milan Cathedral, a large area was set aside for drawing, following an access path to an upper level *casina*, or mason's lodge.[16]

Some drawings were hidden in plain view, as an architectural purloined letter, by locating them in prominent locations. In such cases, sheltering discloses the drawings' latency, perhaps even with ritual or liturgical associations. At the Hellenistic Temple of Apollo at Didyma, for example, full-scale working drawings of the temple still survive in the *adytum*, or inner sanctum, on walls that flank, to the north and the south, the most sacred temple housing the cult statue of Apollo.[17] Accessed at the end of a dark tunnel one meter wide by twenty-one meters long, their ritual significance seems highly plausible. Similarly, in the nave of San Paolo fuori le Mura, a full-scale, *in situ* drawing of St. Peter's cupola was prominently inscribed into the marble floor by Giacomo Della Porta (1532–1602) and Domenico Fontana (1543–1607).[18] Even though it was dismantled after the tragic fire of 1823, a survey of the drawing was nonetheless performed in 1822 by a visiting English architect, Henry Park (1790–1835).[19] Following the historical link between the Constantine basilicas of St. Peter and St. Paul, the inscribed working drawing could help ensure the continuity of St. Peter's during its crisis of reconstruction (1506–1626). The full-scale drawing of St. Peter's, sheltered within the *house* of

St. Paul, preserved the real presence of both saints, simultaneously.[20] Even after the cupola was completed, architects throughout the seventeenth century revisited the pavement markings and had full-scale templates produced from it.[21] Both the Temple of Apollo and St. Paul's basilica describe how *in situ* drawing can activate a relation between the ritual of construction and the ritual function of the architecture, even to the point of being *reused* as working drawings at a later date. Such drawings outlived their strictly instrumental use during design and construction and were, by virtue of their material and privileged spatial relation with the building, reinaugurated with each use of the site.

Michelangelo's choice of drawing location was certainly deliberate.[22] Nestled into the Medici Chapel's apse, raised slightly from the main floor, they were completely *cut-off* from the construction activity at that time, including between thirty and fifty cavers and laborers (Figure 2.2). It was both inside the construction site and removed from it, a kind of sheltering that allowed construction to continue without interfering with it. Located within what would eventually become a small apse for the priest to conduct liturgy, it inversely benefitted from this focal point by being a mere secondary space during the construction period. When Giorgio Vasari (1511–1574) took over the supervision of the chapel in 1555, nearly twenty years after Michelangelo's departure, one of his first acts was to whitewash the walls and vaults of the chapel, so that according to Dal Poggetto it "seems like a mirror," thus covering up Michelangelo's wall drawings.[23] By the time Federico Zuccari (1539–1609) captured the artists of the Accademia del Disegno copying and deliberating over Michelangelo's works in 1565, the wall drawings had long since faded from memory under a thin layer of stucco (Figure 2.3). Today, lacking any further religious function, the apse once again retains its auxiliary character, forcing us to re-enact the sheltering of the drawings. Forgoing the attention of thousands of visitors focused on the sculptural groups, they have entered a new state of occultation. Slowly fading and tucked behind clear, acrylic barriers, they remain sheltered in plain view.

Full-scale

> When you draw a full size of a good Greek original you 'shake hands' with the man who made it […] Half size will not do.[24]

Most prominent among Michelangelo's apse drawings are two, full-scale drawings of the library window, representing the interior and exterior elevation and perfectly aligned on opposing walls. Reaching nearly three meters in height, they are carefully plumbed and measured in black chalk, with some *pentimenti* around the cornices in charcoal (Figure 2.1). Matching the completed construction quite closely, they were probably used as an aid to generate templates, known as *modani*, for the use of stone carvers.[25] When the building itself is utilized as a life-size, working drawing surface, the constructing of place cannot be separated from the place of construction. Thus, domiciliation is a process of preserving the marks and smears on the walls, but it also activates the body postures and gestures that were indexed by such marks, a process akin to shaking hands with the builders. The memory of construction is an imaginary act experienced directly at the site of the drawings' facture.

Experienced in full-scale, the human body acts as a common referent between the working drawings and their *house* of domiciliation. This engagement with the memory of construction is what Giambattista Vico (1668–1744) described as *ingegno*, which is the active, combinatory faculty of putting together past acts and present experiences.[26] In other words, remembering is not just documenting the evidence of past events; it is also the apprehension, or creative

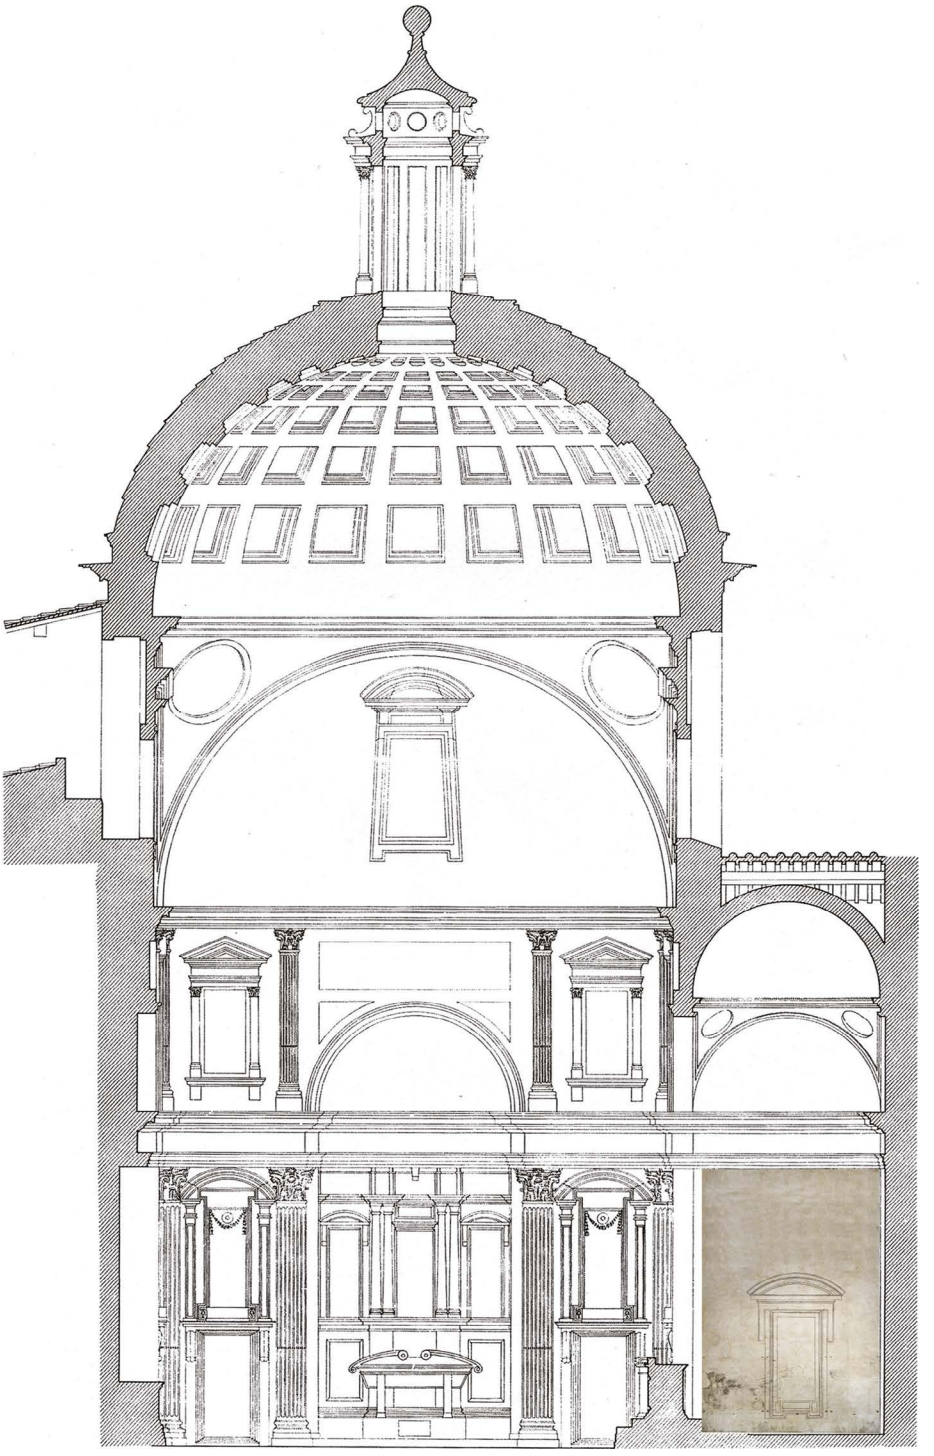

Figure 2.2 Michelangelo and others, plan and section of the Medici Chapel with wall mural overlay, by Jonathan Foote. Survey from Portoghesi and Zevi 1964: 158.

reconstruction, of those events in terms of the present moment.[27] As Vico scholar Donald Verene remarked,

> *Ingegno* is [for Vico] the power of the subject to move from one act of formation of sense to others, to create further acts of formation and to have past acts combine and influence present ones.[28]

This *putting together*, as a fundamental aspect of memory, is what invites the architect to project their own experiences into the drawings, and it is precisely what is activated through an *in situ* approach to them as archival documents.

In modern parlance, we no longer distinguish between full-scale, as a life-size drawing corresponding to the size of the body, and scale 1:1, where the measures between the drawing and the construction mathematically correspond. However, it is this life-size that binds us to the drawings in their experience as an *in situ* archive, and it is what invigorates our capacity of *ingegno* while examining them. Looking back, one may return to the early modern notions of "*la vera grandezza*" or "*la propria forma*," terms used by *quattro*- and *cinquecento* architects to describe a detail drawing in the same size as it appears in life-size. Architects into the twentieth century continued to use value-laden terms, such as true-scale or natural scale. A contemporary term such as, scale 1:1, negates this critical difference, assuming an equivalence between scale, as a relative proportion measured mathematically, and size, as that which is related to life experience.[29] This conflation obscures the possibility of creating working drawings in life-size without actually measuring them, which, interestingly enough, would

never be questioned in sculptural modeling. As such, Michelangelo sketches the wall profiles *as if* he were working within the actual size of the architecture; that is, without any size reduction, while at the same time eschewing any obvious measuring tools necessary for such a procedure.

Besides the full-scale window drawings, a number of other details and construction lines appear near the bottom of the wall, drawn together with assistants while standing on the floor. In a combination of red chalk, black chalk, and charcoal, they appear to be working drawings generated during design discussions. Although there is little evidence of measure or rule, in contrast to the window drawings, these sketch-like marks are remarkably close in dimension to the actual architecture. To take one example, a sketch for a column base in black chalk for the Laurentian Library measures around 115 millimeters in actual size, whereas the column base as-carved, corresponding to the part represented in the sketch, is nearly 125 millimeters (Figure 2.4).[30] This curiously approximate correspondence can only indicate that Michelangelo was making these drawings as if he were imagining the architecture in actual, lived size, but without the use of rationalized measuring devices.[31]

Upon approach, one faces the drawings in just the same way that Michelangelo did. Many of the drawings represent bodies, gestures, and body parts, and produced frontally, they

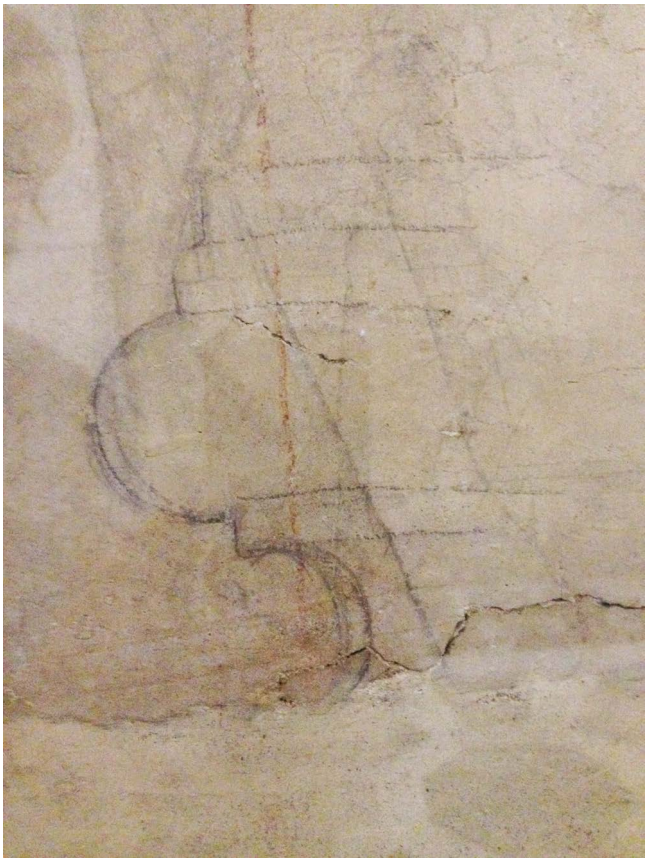

Figure 2.4 Michelangelo, sketch for a column base. Photo by Jonathan Foote with permission from the Museo del Bargello.

indicate the necessity for the artist and his assistants to approach architectural design problems while standing upright, like sculpture and painting.[32] Buried within the architectural palimpsest are scores of figural drawings that constantly challenge any rigid distinction between the architectural and the figural. Indeed, unlike other traditions of *in situ* drawings inscribed on floors, there was an established lineage among Tuscan painters for deliberating over architectural designs on wall surfaces.[33] At Santa Maria del Fiore in 1357, for example, a wall along *Via dei Servi* was plastered for the painting of two column designs in "*vera grandeza*," one by Francesco Talenti (c.1300–1369), and the other by Giovanni di Lapo Ghini (XIV c.), to help choose between the two.[34] Beneath the Medici Chapel, an earlier collection of charcoal wall drawings, referencing the sculptures of the Medici tombs, was exposed in 1975. Magnificently preserved and drawn in life-size, they were tucked into a small, forgotten crypt once utilized for coal storage and possibly inhabited by a fugitive Michelangelo during the Medici siege of 1530.[35]

Drawing dust

> [L'archive] est difficile dans sa materialité.[36]

Common tropes such as "burying oneself in the archive" or "blowing off the dust" of an old document originate in our embodied experience of encountering the contents of an archive as material evidence. This was captured well by Jean Michelet (1798–1874) in 1833, when as Director of the Archives Nationales in Paris he wrote, "these papers and parchments, so long deserted, desired no better than to be restored to the light of day […] as I breathed in their dust, I saw them rise up."[37] Immersed in cotton rags and decomposing animal skins from parchment and leather bindings, this was not just a figure of speech, but an actual physiological consequence.[38] Roland Barthes (1915–1980) called this a kind of ingestion, one where the historian acts as the host for the transubstantiated materials of the past.[39] This digestion or breathing of the materials of the archive is another kind of active remembering—Vico's *ingegno*—which brings the decaying documents again to life. In our case, just as one imagines through Michelangelo's chisel marks the adjacent Medici tombs, so does one re-enact the artist's red chalk deliberations over the cornice designs on the plaster walls. It is an embodied memory that creatively brings together the distant past with the present.

Witnessed *in situ*, the magnificence of the San Lorenzo wall drawings as a material palimpsest, with numerous marks and drawings piled on top of each other, becomes overtly apparent. Layers of drawing materials are, at times, clearly distinct and, at other times, smudged together into a single, pasty mark. There are multiple hands at work, drawn during different periods, probably extending up until the point when they were covered over by Vasari. By actively inspecting the smears, textures, and colors with the curious, roving eye, one activates an embodied vision that, as Alberti wrote in *De Pictura*, "moves rapidly and with great power and remarkable subtlety, penetrating the air." It "flies out to touch the outer parts of the surface," and once locked on a drawing mark, "holds on like teeth to the whole of the outline, [and] forms an enclosure around the entire surface."[40]

Technical analysis has suggested that Michelangelo specifically prepared the wall surfaces of the apse for the purpose of a drawing surface sometime in late 1524 or early 1525.[41] Finished-off with *intonaco*, composed of sifted river sand and slaked lime, and covered in a thin layer of whitewash, the surfaces would have been well-suited for supporting chalk and charcoal drawing materials: large, nearly six meters high, smooth, and with a fine-grained tooth. Michelangelo also added crushed aggregates of discarded roof tiles, possibly contributing to

the amber color of the *intonaco*.[42] The finish of the lateral walls contrasts with the chapel's upper walls and lunette surfaces, which were covered in a bone-white *stucchino* that included pulverized marble dust reduced from workshop left-overs.[43] It is not certain why these surface differences exist, but one possibility is that the *intonaco* was better suited as a working surface than the more expensive and finer-grained *stucchino*. The drawings in the crypt below the Medici Chapel, referenced earlier, also share the same *intonaco* wall finish.[44] On the *intonaco* surfaces themselves, Michelangelo employed three different drawing materials: black chalk, red chalk, and charcoal.

The drawing materials have been meticulously identified, recorded, and analyzed by Dal Poggetto and his team of restorers. The highly technical approach, while critically important, can also detach us from their full significance. Looking behind the marks, one re-enacts the decision to choose each drawing material. This familiar musing, required of any drawing act, even by children, activates the combinatory power of the imagination when gazing upon these marks. In a detail for the Medici tomb, for example, a red chalk profile traces a prominent path through the smudgy marks in black chalk and charcoal marks (Figure 2.5). Red chalk

Figure 2.5 Michelangelo, sketch for the Medici tomb. Photo by Jonathan Foote with permission from the Museo del Bargello.

was probably readily at hand, as it was the tool commonly used by sculptors and masons when working directly on the materials, a practice mentioned by Alberti in the use of red chalk as a tool for designating on-site revisions.[45] In Michelangelo's use of it, he rarely combined red and black chalk, except in the making of paper templates, where they were commonly used together.[46] In a separate detail, where the library's full-scale window drawings are rendered in black chalk, the *pentimenti* at the cornice details are instead rendered in charcoal. The switching between drawing materials, rendered over top of one another, is certainly reflective of dialogic conditions under which they were made, one where each drawing material was chosen in the moment under highly localized conditions.

The provisional quality of Michelangelo's chalk and charcoal drawings stands in stark contrast to the tradition of laboriously inscribing *in situ* drawings into marble pavements, plaster floors, and limestone walls. The example given of the cupola drawing at St. Paul's suggests that there was some imperative among the makers to protect the drawing against its future erasure, but with the San Lorenzo wall drawings, no such impulse seems evident. The rapid marks and dusty drawing materials serve as an important counterpoint in the chapel today, which has been frozen in time within the regimes of cultural heritage. We can no longer inhabit the space as the students of the academy did, as it was captured so well by Zuccari (Figure 2.3). In their afterlife, with rules in place to prevent new generations of curious onlookers from making drawings of their own, Michelangelo's fragile material traces are actually a potent reminder of the durability of architectural demonstrations. Nearly five hundred years later, an architect can observe the walls and identify with them, even while knowing little or nothing of their factual history.

Standing next to the walls and breathing their dust, the combined presence of all the bodies and materials that have been associated with the place, including our own, are brought into focus. In addition to Michelangelo's chalk and charcoal marks, incrusted onto the walls, one wonders about a possible lost hair of Vasari himself, buried deep in the cracks, leftover from his decision to cover the wall drawings; or the oily stains found among the marble and *pietra serena*, left by the touch of countless visitors, maybe even from members of the *Accademia del Disegno*; or even the contemporary bronze brackets, drilled indiscriminately into the drawing surface, placed there to prevent our hands and bodies from spoiling them (Figure 2.6). Dal Poggetto's archive, photographically reproduced and digitized, might never be ingested, but the wall drawings themselves are slowly shedding their dust.

Domiciled demonstrations

The San Lorenzo wall drawings have been well-studied, but they have not yet been understood as what Marco Frascari called *demonstrations*, as graphic performances based on the reciprocity of constructing and construing.[47] When *in situ* drawings become archives of the building itself, demonstrations long since performed become latent artifacts that show or point out (from the Latin *monstrare*) architectural construing through the memory of construction. Taken as such, the emphasis necessarily shifts away from their specific analytical implications and toward their material and spatial relationship to the place where they reside.

Unlike the archive one typically encounters, where documents are collected from many places, the San Lorenzo drawings are an archive primarily by virtue of their place, returning to the original notion of the *arkheion*. Derrida's "house arrest" materially binds the drawings and the architecture, guaranteeing they are apprehended in terms of the place where they were produced. This ambiguity between the drawing *of* the building and drawing *on* the building secures their status as sheltered, unfinished working drawings that disclose new

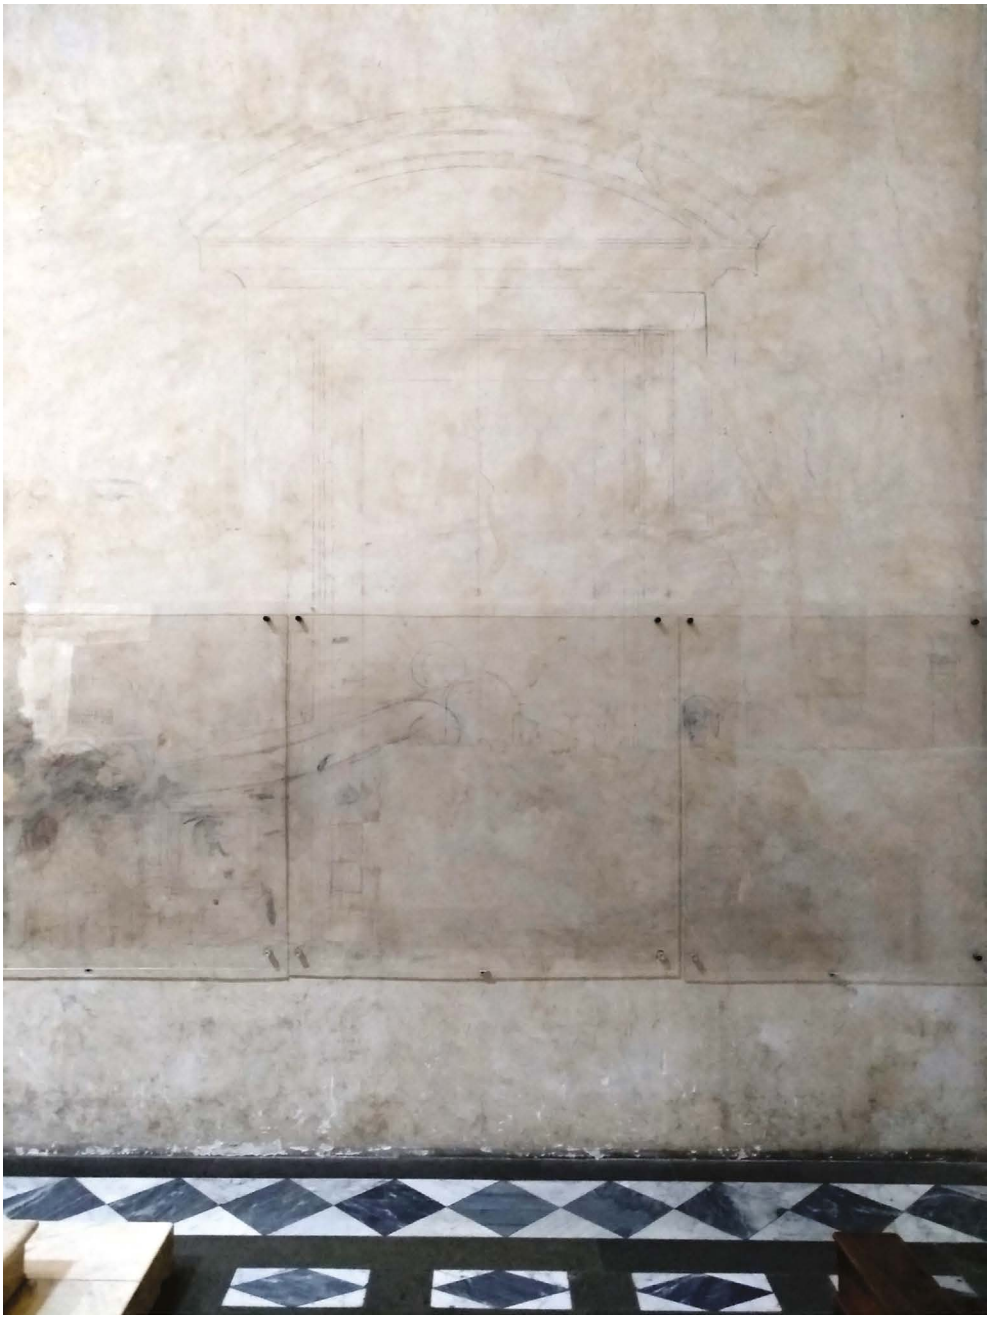

Figure 2.6 Contemporary conditions with clear acrylic barrier and bronze wall mounts. © Photo by Franco Pisani.

reflections on the relationship between drawing and building. We inhabit the archive in relation to our bodies and memories, a condition that offers them up as historical documents re-enacted in the present, an act of *ingegno*.

Notes

1 Poggetto 1979: 24–26, Poggetto 2012: 19–21. The discovery followed a series of unlikely finds, dating back nearly a year, which identified figural wall sketches by Michelangelo in two other locations adjacent to the Medici Chapel.

40 Alberti 1972: 41–42.
41 Elam 1981: 592–594, Wallace 1994: 171.
42 "*E decto dì re(n)de' a Stefano un grossone p(er) una stafa di ferro pel pestello cho(n) ch(e) si pesta gli e(n)brici vechi p(er) lo stucho*." See Ciulich and Barocchi 1970: 118. Dal Poggetto mentions the amber color of the intonaco, although he does not connect the color with brick dust, Poggetto 1979: 42. Crushed aggregates from earthenware was common for such finishes, dating to Roman times, Trogu Rohrich 1999: 51–62.
43 Poggetto 1979: 41. The *stucchino* technique was imported from Rome only a few decades earlier.
44 Poggetto 1979: 33. Michelangelo's other remaining wall drawing surviving from his house was applied to a much rougher *arriccio* surface, which was a typical supporting layer for mural painting and fresco that utilizes larger sand aggregates. Bambach 2013: 340.
45 Alberti 1988: 360. The relationship of red chalk (*pietra rossa* or *matita rossa*) in connection with sculptors and masons has been explored by Zanchettin 2011: 161 and Hirst 1988: 5–8.
46 Elam 2006: 50–55.
47 Frascari 1990: 14.
